                     -!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUB SPECIFICITY: Synthesized in Caenorhabditis only by 32 cell building the incestine of adult hermaphroditic individuals; they are cotranslationally secreted into the body cavity and subsequently taken up by the gonad.
-!- SIMILARITY: Contains 1 VWFD domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Campylobacter jejuni.

                                                                                                                                                                                                                                                                                                                          -1- FUNCTION: Catalyzes the formation of 5-methyl-uridine at position 54 (M-5-U54) in all tRNA (By similarity).
-1- CAPTALYTIC ACTIVITY: S-adenosyl-L-methionine + tRNA = S-adenosyl-L-homocysteine + tRNA containing thymine.
-1- SIMILARITY: Belongs to the RNA MSU methyltransferase family. TrmA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Buchnera aphidicola (subsp. Acyrthosiphon pisum) (Acyrthosiphon pisum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

BLOSUM62 Gapop 10.0 , Gapext 0.5 Scoring table:

```
The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations at red, and E22G has a bigger compared to other GFP's making it very cultable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein kinase activity, or for measuring protein calcistribution. The fluorescent protein tags in transgenic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker to be used in cell morphology, as transfection marker. The fluorescent protein is also used in setul as a cell or organelle integrity marker, a marker to be used in combination with fluorescence activated cell sorting (FACS). The novel proteins can also be used as reporters to monitor live or dead biomass of organisms, such as fungi. The fluorescent protein is also useful as markers in transcriptional and translational fusions for performing transposons encoding the fluorescent protein are useful for screening promoters and for tagging plasmids and chromosomes. The fluorescent protein engineered into the genome of a phage is useful for designing diagnostic tool. The present sequence is a DNA encoding cenhanced F64L-B222G jellyfish green fluorescent protein (GFP) mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

The invention relates to a novel cell, comprising three heterologous conjugates (HC), a first HC (HC1) comprising an anchor protein that specifically binds to an internal structure within the cell conjugated to an internal structure within the cell conjugated to an interactor protein (IP) of type A, a second HC (HC2) comprising IP of type B conjugated to a first protein of interest, and a third HC (HC3) comprising a second protein of interest conjugated to detectable group. The cell is useful for detecting if a compound disrupts or induces the interaction between two intracellular proteins. The cell is also useful for screening compounds that modulate the interaction between two intracellular proteins. The present sequence is used in the exemplification of the invention

The invention relates to determining, if a compound, is a dislocator of PDE4. The method comprises testing if the compound removes PDE4 spots, which may optionally be induced by a Roliptam-like reference compound, and testing if it inhibits the catalytic activity of the PDE4, where the compound is a dislocator of PDE4, if it removes PDE spots and if it does not inhibit the catalytic activity of PDE4. The method is useful for identifying compounds useful for the treatment of diseases of the central nervous system such as depression and for the treatment of inflammatory disease, respiratory diseases, chronic obstructive pulmonary disease (COPD), including asthma, chronic bostructive pulmonary disease conductors shock, toxic shock syndrome, systemic lupus erthematosis, psoriasis, bone resorption diseases, reperfusion injury, cancer and HIV compound with affinity for the catalytic site on intracellular distribution of the PDE for the preparation of a medicament. The present
                                                                                                                           Determining if a compound is a dislocator of PDE4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.

The invention relates to determining, if a compound, is a dislocator of PDE4. The method comprises testing if the compound removes PDE4 spots, which may optionally be induced by a Rolipram-like reference compound, and testing if it inhibits the catalytic activity of the PDE4, where the compound is a dislocator of PDE4, if it removes PDE spots and if it does not inhibit the catalytic activity of PDE4. The method is useful for compound suseful for the reatment of diseases of the central nervous system such as depression and for the treatment of inflammatory disease such as joint inflammation, Crohn's disease, inflammatory bowel compounds useful for the treatment of inflammatory disease, respiratory diseases, chronic obstructive pulmonary bowel compound synchia systemic lupus erthematosis, candetoxic shock toxic shock syndrome, systemic lupus erthematosis, psoriasis, bone resorption diseases, reperfusion injury, cancer and HIV compound with affinity for the catalytic site on intracellular distribution of the PDE for the preparation of a medicament. The present sequence represents the amino acid sequence of a HSPDE444-E222G fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1014 VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 1073
                                                                                                                                                                                                                                                                                                                  Determining if a compound is a dislocator of PDE4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     953
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations at FedL and E222G has a bigger compared to other GFP's making it very suitable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution. The fluorescent protein tags in transgenic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker to be used in combination with fluorescence activated and as a marker to be used in combination with fluorescence activated cells sorting (FACS). The novel proteins can also be used as reporters to monitor live or dead biomass of organisms, such as fungi. The fluorescent protein is also useful as markers in transcriptional and translational tusions for performing transposons encoding the fluorescent protein are useful for screening promoters and for tagging plasmids and chromosomes. The fluorescent protein engineered into the genome of a phage is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel fluorescent protein in in vitro assay for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution, has a green fluorescent protein with F64L and E222G mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             designing diagnostic tool. The present sequence is enhanced F64L
                                                                                                                                                       /note= "Wild type Phe substituted with Leu; This corresponds to position 64 in the wild type protein"
Jellyfish, green fluorescent protein, GFP, protein redistribution, cellular function, genetic reporter; mutant, Stoke's shift, mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 1264; DB 5; Length 239;

The invention relates to systems, methods and reagents for cell-based screening or detection of compounds which affect particular biological functions. The methods of the invention utilise fluorescent biodetector collected which, when acted on by a compound of interest, cause an alteration in the cellular distribution of at least the fluorescent alteration in the cellular distribution of at least the fluorescent collects. The one embodiment, the biosensors comprise hear shock proteins or alteration in the cellular distribution of at least the fluorescent protein (e.g., jellyfish green fluorescent protein (e.g., jellyfish green fluorescent protein can be used to detect protease or another embodiment biodetector proteins can be used to detect protease another embodiment biodetector fusion proteins comprise one or more callular localisation signal. The latter two protease, and at least one cellular localisation signal. The latter two components may be from heterologous sources. Due to the protease, or may be from heterologous sources. Due to the callular localisation signal the cell. Once acted on by the protease of interest, the region of the cell. Once acted on by the protease of interest, the fluorescent protein to be directed to a different cellular sequence. The second localisation signal attached to the fluorescent protein to be directed to a different cellular comparatment after cleavage of the protease recognition sequence. The change in distribution of the fluorescent protein can be detected using imaging methods with a high degree of spatial resolution. The methods and imaging methods with a high degree of spatial resolution.
                                                                                                                                                                                                                                                                                                  Biodetector protein; fusion protein; recognition site; cellular targetting sequence; cellular localisation; fluorescent protein; protease activity detection; toxin detection; cellular stress detection; drug discovery; cell based screening.

```
cellular activities and to screen compounds which modulate these example, may be used for the screening of compounds which modulate these apoptosis, while biosensors containing a recognition site for caspase, for appoptosis, while biosensors containing other protease recognition sites may be used for the detection of proteolytic toxins (such as anthrax lethal factor). The method provides improved target validation and candidate compound optimisation by combining many cell screening formats with fluorescence-based molecular reagents and computer-based feature extraction, data analysis and automation, resulting in increased quantity and speed of data collection and faster evaluation of drug candidates. Sequences AAB22881-B22885 represent fluorescent proteins which may used as components of biosensor fusion proteins of the invention

protein based on the Aequorea green fluorescent protein (GFP). The emission intensity changes as pH varies between 5 and 10 of the present protein are novel. The functional engineered fluorescent proteins show reversible changes in fluorescence over physiological pH ranges. They can also be used for determining the pH of samples and cells. The polynucleotides can also be used to produce transgenic animals. The fluorescent protein pH sensors can be delivered to cells in the form of polynucleotides encoding the protein sensor fused to a targeting signal. The targeting signal directs the expression of the protein sensors to restricted cell locations. This makes it possible to measure the pH of a precisely defined cellular region or organelle
                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present sequence is a fluorescnet protein used in the construction of a fluorescent protein indicator. The indicator comprises a sensor polypeptide that is responsive to a chemical, biological, electrical or physiological parameter, and a fluorescence protein functional group. The sensor polypeptide is operatively inserted into the fluorescent moiety. The fluorescent indicator is useful for detecting the presence of a response inducing member in a sample. The method involves contacting the sample with the indicator and detecting a change in fluorescence, in polypeptide. The novel fluorescent proteins are advantageous due to their reduced size as compared to the FRET (fluorescence resonance energy
                                                                                                                                                                                                                                                                                             Novel fluorescent proteins comprising a sensor protein inserted into them, useful for measuring the response of a sensor biological, chemical, electrical or physiological parameter in vivo or in vitro.

                                                                                                                                                                                                                                                The present sequence is that of the EGFP signal domain, which can be included in novel recombinant protease biosensors (PBS) of the invention. The PES (see AAY79618-54) comprise: a first domain (see AAY79579-87) comprising at least 1 detectable polypetide signal such as the present comprising at least 1 asset 1 asset 1 asset 1 asset 1 asset 1 protease recognition site, and a third domain (see AAY79633-623) comprising at least 1 reactent target sequence. A recombinant nucleic comprising at least 1 reactent target sequence. A recombinant nucleic acid (see AAA27627-43) encoding the PB, an expression vector, and a contacting a nost cell are also claimed. A claimed method for genetically engineered host cell are also claimed. A claimed method for contacting a host cell that possesses the recombinant PB with a test compound, and determining the PB distribution in the host cell, where compound, and determining the PB distribution in the host cell, where compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the recombinant PB with a test recombinant PB with a test recombinant ps. or the vector, or the vector or the vector or the vector or changes in the PB is useful in high content screens to detect in vivo activition of enzymatic activity, and to identify specific activity based or claavage of a known recognition motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

                                                                                                                                                                                      The invention provides melanin concentrating hormone (MCH) receptor (MCHR) chimeric and fusion proteins. The MCHR chimeric proteins comprise MCHR polypeptide regions from different species. The MCHR fusion protein comprise MCHR polypeptide region and a fluorescent polypeptide region protein joined directly, or via a linker, to the carboxy side of the MCHR polypeptide region. The MCHR fusion proteins can be expressed by standard recombinant methodology. MCH action promotes feeding (orexigenic) and up regulation of MCH activity stimulates food intake. The present sequence represents a A. victoria green fluorescent protein (GFP) and a linker

death rate of a micro-organism within a predetermined time period in a desired environment. The method comprises introducing at least two reporter genes encoding luminescent and/or fluorescent products into the micro-organisms, incubating the micro-organism within the desired environment, and detecting luminescence and/or fluorescence after a predetermined time period. Use of two different markers within a micro-organism enables the differentiation between growth and death rates. The method is used to assess the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The present sequence represents a green fluorescent protein (GFP), and is encoded by a plasmid which encodes luminescent and fluorescent proteins, and is and is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 LVTTLTYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

                                                                                                             The invention relates to a gene encoding proteins having cyan-green fluorescence characteristic and having a function of showing stable fluorescence characteristic in acid region. A method for the preparation of a cyan-green fluorescent protein is provided which involves a transformant transformed by a recombinant vector comprising the gene, where the transformed is cultured and the protein is collected from the culture. The present sequence represents the A. victoria green fluorescent protein (EGFP)
                                                                                                                                                                                                                                               9

The invention describes methods of automated detection, classification and identification comprising treating cells containing luminescent reporter molecules (I) in array of locations with a test substance, where (I) are detectors, classifiers or identifiers, imaging cells in each clocation to obtain luminescent signals and converting optical information into digital data to interpret presence of toxins in the test substance. The method are useful for detection of toxins chosen from proteases, ADP-cribosylating toxins, cytotoxic phospholipases, and exfoliative toxins. Three classes of cell-based luminescent reporter molecules such as detectors, classifiers and identifiers are described and serve as creporters of toxic threat agents. The first two levels of characterisation ensure a rapid readout of toxin class without contains the ability to detect many new mutant toxins or dissect several complex mixtures of known toxins. This is the amino acid sequence of a protease biosensor related signal sequence used in the cell-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LVTTLSYGVOCFSRYPPHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

The invention relates to a method for mutagenesis that comprises synthesising a mutated strand and a complementary strand by use of synthesising a mutated strand and a comprises a DNA synthesis in which one cor megaprimers. The method basically comprises a DNA synthesis in which one cor more primers that have a nucleotide sequence containing at least one cor more primers that have a nucleotide sequence containing at least one and then subjected to an elongation reaction using a thermostable high-correct then subjected to an elongation reaction using a thermostable high-correct the elongated terminus are ligated by means of a thermostable DNA ligase to synthesise a circular DNA containing the primers; a digestion in which the step of DNA synthesis is repeated several fines to amplify the DNA containing the primers and then, a least DNAs other than the amplified circular DNA are digested into several fragments obtained in the step of DNA synthesis in which, with the several fragments obtained in the step of digestion as megaprimers, the megaprimers are annealed to the circular DNA synthesised above, followed by an elongation reaction performed using the thermostable high-fidelity DNA polymerase. The method is useful for mutagenesis, particularly for introducing centain mutations at certain sites of the nucleotide sequence. The present method is simple, and annealed contain sites of the mutagenesis present sequence is somether and an annealed contain sites of the nucleotide sequence. The present sequence is somether and an annealed contain contain the sequence is an annealed to be an annealed to the contain mutations at the sequence of a present sequence is somether and an annealed contain contain the sequence is an annealed to the sequence. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 LVITLIYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERIIFFKDDGNYKTRAEVKFEGDIL 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to chimeric phosphorylation indicators comprising a phosphorylation polypeptide and a fluorescent protein or in operative linkage, a donor molecule, a phosphorylatable domain, a phosphoaminoacid binding domain (PAABD) and an acceptor molecule. The phosphoaminoacid binding domain (PAABD) and an acceptor molecule. The phosphoaminoacid in a biological sample. They are also useful in high throughput analysis e.g. for detecting a kinase inhibitor or phosphatase inhibitor. The present sequence is Aequorea victoria enhanced green fluorescent protein (EGFP) used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 LVITLIYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERIIFFKDDGNYKTRAEVKFEGDTL 120

GENERAL INFORMATION:
APPLICANT: BOONN, Same et al
TITLE OF INVENTION: NOVEL FLUORESCENT PROTEINS
FILE REFERENCE: 3759-0115P
CURRENT FILING DATE: 2001-06-19
NUMBER OF SEQ ID NOS: 24
SOFTWARE: Patentin version 3.0 ORGANISM: Aequoria Victoria 181

```
ures to identify compounds modulating intracellulationsphodiesterase (PDE) enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        US-10-257-909A-32

Sequence 32, Application US/10257909A

Sequence 32, Application US/10257909A

Sequence 32, Application US/2030187056A1

GENERAL INFORMATION:
TITLE OF INVENTION: distribution of phosphodiesterase (PDE) enzymes

TITLE OF INVENTION: USA-0125P

TITLE OF INVENTION: 01257,909A

CURRENT APPLICATION NUMBER: US/10/257,909A

CURRENT FILING DATE: 2002-10-17

NUMBER OF SEQ ID NOS: 36

SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

Sequence 4. Application US/09999745

GENERAL INFORMATION:
APPLICANT: THE REGENTS OF THE UNIVERSITY OF CALIFORNIA
APPLICANT: Taien, Roger Y.
APPLICANT: Baird, Geoffrey
TITLE OF INVENTION: CIRCULARLY PERMUTED FLUORESCENT PROTEIN INDICATORS
TITLE REFERENCE: RECEN1470-1
CURRENT APPLICATION NUMBER: US/09/999,745
CURRENT FILING DATE: 2001-10-23
PRIOR APPLICATION NUMBER: 09/316,920
PRIOR APPLICATION NUMBER: 09/316,920
NUMBER OF SEQ ID NOS: 67
SOFTWARE: Patentin version 3.0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
